

Objects in JavaScript (Object Literals & Accessing Values)

→In JavaScript, an object is a collection of related data in key–value pairs.

→ Keys are also called properties.

→Values can be anything: string, number, array, boolean, or even another object.

1.Creating an Object (Object Literal)

→The easiest way to create an object is using curly braces {}.
(This is called an object literal)

2.Accessing Object Values

There are two ways:

a.Dot Notation

Example:
object.property

b. Bracket Notation

Example:
object["property"]
