

## Looping Through Arrays (for, forEach, map)

### 1.for loop (classic way)

→Good when you need an index or want full control over how you loop.

### 2.forEach()

→Runs a function once for each element.

→Cannot stop in the middle using break or return (except inside special cases).

### 3.map()

→Loops through the array but returns a new array with the transformed values.

→Perfect when you want to create another array from the old one.
