

Event Loop, Microtask Queue & Callback Queue

Event Loop :

The Event Loop is like a traffic controller in JavaScript.

1. Call Stack

→ The place where JavaScript executes functions one by one.

2. Microtask Queue

→ Holds "microtasks" → very short, high-priority tasks. Examples:

Promise callbacks (.then), MutationObserver.

3. Callback Queue

Holds normal async callbacks: setTimeout, setInterval, DOM events (click, keydown)
