

History API in JavaScript

→The History API allows you to interact with the browser's session history (the list of pages the user has visited in the current tab).

`history.length`→Checking History

`history.back()`→Moves one step backward (like clicking the back button).

`history.forward()`→Moves one step forward (like clicking the forward button).

`history.go(n)`→Moves forward or backward by n steps.

Manipulating History Entries (Single Page Applications)

The powerful part of the History API is when you don't actually reload pages but simulate navigation — useful in Single Page Applications (SPAs).

`history.pushState(state, title, url)`

→Adds a new entry to the history stack without reloading the page.

`history.replaceState(state, title, url)`

→Replaces the current history entry instead of adding a new one.
