

## DOM Introduction (What is DOM?)

DOM stands for Document Object Model.

→ It is not part of JavaScript itself.

→ It is provided by the browser to let JavaScript interact with the HTML document.

Think of the DOM as a tree-like structure where:

→ The whole HTML page = Document

→ Each HTML element (tag) = Node in the tree

→ JavaScript can read, add, change, or delete these nodes.

### Html page

```
<!DOCTYPE html>
<html>
  <head>
    <title>DOM Example</title>
  </head>
  <body>
    <h1 id="title">Hello World</h1>
    <p class="text">This is a paragraph.</p>
  </body>
</html>
```

## DOM Tree Representation:

```
Document
├── html
│   ├── head
│   │   └── title → "DOM Example"
│   └── body
│       ├── h1#title → "Hello World"
│       └── p.text → "This is a paragraph."
```
