

JavaScript Array filter() Method

The filter() method creates a new array with all elements that pass a condition (test function).

→ It checks each element of the array.

→ If the condition is true → keeps it.

→ If false → removes it.

→ Original array stays unchanged.

Syntax

```
let newArray = array.filter(function(currentValue, index, arr) {  
  // return true or false  
});
```

currentValue → the current item in the array

index → (optional) index of the item

arr → (optional) the whole array
