

JavaScript Array map() Method

The map() method creates a new array by applying a function to each element of an existing array.

→ It does not change the original array.

→ It always returns a new array with the transformed values.

Syntax:

```
let newArray = array.map(function(currentValue, index, arr) {  
  // return something  
});
```

currentValue → the current item in the array

index → (optional) index of the item

arr → (optional) the whole array
