

Introduction to BOM (Browser Object Model)

→The Browser Object Model (BOM) is a set of objects provided by the browser (not HTML, not CSS) that allow JavaScript to interact with the browser itself.

→Think of BOM as everything the browser gives us in addition to the webpage (DOM).

→Example: working with the window, history, location (URL), navigator (browser info), and screen.

→**DOM** = about the *webpage (HTML)*.

→**BOM** = about the *browser (outside the page)*.
