

Window, Navigator, Screen & Location Objects

1. window Object:

→The global object in the browser.

→Everything in JavaScript in a browser environment is inside a window.

For example:

`window.innerWidth`=> width of the browser window

`window.innerHeight`=> height of the browser window

2. navigator Object:

→Represents information about the browser itself.

→Useful to know what browser or device the user is on.

For example:

`navigator.userAgent` → info about browser/device

`navigator.language` → browser language

`navigator.onLine` → check internet connection

3. screen Object:

→ Gives details about the user's screen (not just the browser window).

For Example:

screen.width & screen.height → total screen size

screen.availWidth & screen.availHeight → available screen (excluding taskbar etc.)

screen.colorDepth → number of bits per pixel

4. location Object:

→ Represents the current URL of the browser tab.

→ Lets you read or change the page location.

For Example:

location.href → full URL

location.hostname → domain (like google.com)

location.pathname → path (/about, /home etc.)
